eigenfunctions of the laplacian of a riemannian manifold can be described in terms of vibrating membranes as well as quantum energy eigenstates this book is an introduction to both the local and global analysis of eigenfunctions the local analysis of eigenfunctions pertains to the behavior of the eigenfunctions on wavelength scale balls after re scaling to a unit ball the eigenfunctions resemble almost harmonic functions global analysis refers to the use of wave equation methods to relate properties of eigenfunctions to properties of the geodesic flow the emphasis is on the global methods and the use of fourier integral operator methods to analyze norms and nodal sets of eigenfunctions a somewhat unusual topic is the analytic continuation of eigenfunctions to grauert tubes in the real analytic case and the study of nodal sets in the complex domain the book which grew out of lectures given by the author at a cbms conference in 2011 provides complete proofs of some model results but more often it gives informal and intuitive explanations of proofs of fairly recent results it conveys inter related themes and results and offers an up to date comprehensive treatment of this important active area of research

many methods have been proposed for the solution and simulation of medium or large size models under the assumption of rational expectations the purpose of this paper is to present these methods and to show how and where each can be applied the methods fall into two groups methods in the first can be used to solve for perfect foresight paths in non linear models methods in the second can be used in linear models to solve either for paths or processes followed by endogenous variables all the methods described here have been used in empirical applications and computer algorithms are available for most
